BIPOLAR DISORDERS Factsheet

November 2021

What are antidiabetic medications?

Peroxisome proliferator-activated receptor-gamma (PPAR- γ) agonists such as pioglitazone are used to treat type 2 diabetes. In the context of comorbid diabetes and depressive disorders, studies have shown that pioglitazone also has antidepressant properties. This topic assesses the evidence for antidiabetic medications for the treatment of depression in people with bipolar disorder.

What is the evidence for antidiabetic medications?

Low quality evidence is unable to determine the benefits of pioglitazone for depression in people with bipolar disorder. Note that this result was due to only one small study of people with bipolar disorder. When the analysis also included people with major depression, the results significantly favoured pioglitazone for the treatment of depression.

HOW YOUR SUPPORT HELPS

We are able to make significant advances due to the generosity of countless people. Your donation allows us to continue to work towards transforming lives. For information on how you can support our research, phone **1300 888 019** or make a secure donation at neura.edu.au.

NeuRA

Discover. Conquer. Cure.

NeuRA (Neuroscience Research Australia) is one of the largest independent medical and clinical research institutes in Australia and an international leader in neurological research.

Diseases of the brain and nervous system pose the greatest health, economic and social burden of any disease group because they are chronic, debilitating and have no known cures.

Medical research is the cornerstone of efforts to advance the health and wellbeing of families and the community. Our dedicated scientists are focussed on transforming their research into significant and practical benefits for all patients.

While we hope you find this information useful, it is always important to discuss any questions about bipolar disorder or its treatment with your doctor or other health care provider.
